THE HIDDEN TRAPS IN DECISION MAKING

WHY DO BODY CORPORATES MAKE BAD DECISIONS AND WHAT TO DO ABOUT IT?

This session was inspired by the article 'The Hidden Traps in Decision Making' by John S. Hammond, Ralph L. Keeny and Howard Raiffa.

Published in the Harvard Business Review, September-October 1988

How would you answer these two questions:

- Is the population of Brazil greater than 80 million?
- What is your best estimate of the Brazil's population?

THE ANCHORING TRAP

- When considering a decision we give disproportionate weight to the first information we receive.
- Old numbers become anchors making it hard to project future numbers.
- Good negotiators use anchors as a bargaining tactic.

How to Avoid the anchoring trap:

- View a problem from different perspectives.
- Think through your position before any negotiations.
- Be wary of the information you give to consultants.

THE STATUS QUO TRAP

- Decision makers display a strong bias towards maintain the status-quo.
- Breaking the status quo-means taking action and responsibility. People are afraid of that because it opens them to criticism and regret.
- The more choices you are given, the more pull the status quo has.
- People often say they will rethink something 'later' but later is usually never.

How to avoid the status-quo trap:

- The status quo may be the best choice but don't choose it because it makes you comfortable.
- Ask whether you would choose the status quo if it wasn't the status quo.
- Avoid exaggerating the effort or cost of change.

THE SUNK COST TRAP

- Sunk costs are expenses that cannot be recovered.
- We know that sunk costs are irrelevant to present decision making but they prey on our minds.
- People can't free themselves from past decision making because they are unwilling to make a mistake.

How to avoid the sunk cost trap:

- Listen to views of people who were uninvolved in earlier decisions.
- Don't blame people if a decision is changed.
- When you find yourself in a hole the best thing to do is stop digging.

THE FRAMING TRAP

- The first step in making a decision is to frame the question.
- When choosing between two identical beef products, most people will select the one labeled "80% lean" because it sounds healthier, even though it's the same as the "20% fat" option.
- People tend to adopt the frame presented to them rather than reframing a situation in their own way.

How to avoid the framing trap:

- Don't accept the initial frame.
- Frame the issue in a different way.
- Pose the issue in a neutral way.

AWARENESS

- The best protection against psychological traps is awareness.
- Forewarned is forearmed.
- Even if you can't eradicate psychological distortions you can build tests into your decision making process that can uncover errors in thinking.
